

bso2 Monitor Reference

Target: W65C02EDU | Source: SRC/bso2.asm | Generated: 2026-02-23

0) Naming

`bso2` is the preferred written form in this manual.

It is intentionally dual-meaning and retro-styled:

- `b` = 6 = Basic
- `s` = 5 = System
- `o` = 0 = Operations
- `2` = 2 = /2 (homage to IBM System/36)

That makes `6502` a visual shorthand for `bso2`.

Expanded meaning: Basic System Operations/2.

Release marker format: `R#M#V#I##` where `I` means INTERNAL.

1) Startup / Prompt Behavior

On reset with valid reset cookie, boot choices are C/W/M:

C = clear RAM (confirm Y/N)

W = warm start

M = enter monitor

Power-on prompt uses C/M with a 6-second wait and > tick markers; timeout defaults to C.

Reset-cookie prompt uses C/W/M with a 6-second wait and < tick markers; LEDs blink every ~333ms while waiting and timeout defaults to M.

Boot-choice and clear-confirm prompts echo keypresses in uppercase.

C/W/M Decision Truth Table

Condition	Input	Result
Power-on (no valid reset cookie)	C	Enter clear path.
Power-on (no valid reset cookie)	M	Enter monitor path.
Power-on (no valid reset cookie)	Timeout	Default to clear path (C).
Power-on (no valid reset cookie)	Invalid key	Ignored; prompt/countdown continues.
Reset with valid cookie	C	Enter clear confirmation prompt Y/N.
Clear confirmation	Y	Run clear-memory path.
Clear confirmation	N	Abort clear and continue warm path (W-equivalent branch).
Reset with valid cookie	W	Warm-recovery monitor path (no clear); may print terse restart hints.
Reset with valid cookie	M	Clean monitor path.

Reset with valid cookie	Invalid key	Ignored; prompt/countdown continues.
Reset with valid cookie	Timeout	Default to monitor path (M).

Note: this is the default behavior for the currently installed vector trampolines/handlers; future trampolines or handlers may implement different startup policy.

Warm-recovery hints are advisory only; they do not auto-resume execution.

Default terminal width is 80 columns at reset.

Default runtime policy enables both I T0 1 and I I 1 at boot (Timer1 free-run on, CPU IRQ enabled).

EDU LED heartbeat timing from Timer1: base 122.0703125 Hz (period 8.192 ms), overlay toggle 0.476837158 Hz (~2.097 s per edge), full blink cycle 0.238418579 Hz (~4.194 s period).

Runtime terminal control is via T: T/T C clears viewport; T 20|40|80|132 sets wrap width.

Legacy width-prompt timeout byte remains pinned at \$007B (TERM_WIDTH_TIMEOUT) for compatibility.

After clear/startup, the sign-on banner (BSO2_INIT) is printed:

```
**** basic system operations/2 ****
**** b s o / 2 R0M0V2I01 ****
**** 6 5 0 2 ****
```

Monitor prompt is a single - character on a new line.

2) Command Summary

Cmd	Syntax	Behavior / Output	Flags / Notes
?	?	Short help line.	Quick command list only.
H	H [A P M S]	Help index or scoped help sections.	H=index, H A=all, H P=protection, H M=memory/tools, H S=steering.
Z	Z	Clear RAM after Y/N confirmation.	Zeroes \$0200-\$7EFF . Does not zero \$0000-\$01FF (ZP/stack) or \$7F00-\$7FFF (I/O area).
T	T, T C, T 20 40 80 132	Terminal clear and width control.	T / T C : emits CR then LF x127. Width applies to global output wrapping.
D	D [START [END]]	Hex+ASCII dump. END is inclusive.	D alone repeats last span from next address. Hex/ASCII fields show an 8+8 split.
U	U [START END]	Disassemble as 65C02 mnemonics and operands.	END is inclusive. Bare U repeats from saved next-instruction address. Emits

			ADDR: MNN OPERAND .
A	A START [INSN]	Tiny 65C02 assembler, interactive at next address.	Example: A 1000 LDA #FF then prompt A 1002: . exits. No labels/forward refs. Relative branches accept absolute hex targets and are range-checked. Explicit accumulator form like INC A is supported.
X	X	Reserved for future command family.	No active behavior in current firmware.
I	I, I A, I T0 [0 1], I I [0 1], I C <RPN...> or IC <RPN...>	Info root, about text, timer heartbeat toggle/query, IRQ mask toggle/query, or 16-bit hex RPN evaluation.	I T0 =show Timer1 heartbeat state, I T0 1=enable, I T0 0=disable. I I =show CPU IRQ mask state, I I 1=enable IRQ, I I 0=disable IRQ. Boot defaults are I T0 1 and I I 1. RPN values are 1..4 hex digits (optional \$), operators: + - * / & ^ ~, output I C = \$HHHH .
R	R START, R [A=HH] [X=HH] [Y=HH], or !R START	Run or resume based on debug-context state.	If no debug context exists, R START executes from address. If debug context exists, bare R resumes via RTI with optional A/X/Y overrides; address-form prints R CTX ACTIVE, R [A/X/Y=] or !R START unless forced with !R START .
N	N	Run to next sequential instruction.	Implements next-stop by patching a temporary BRK at PC+len(opcode) . RAM only; ROM/I/O patch targets are

			rejected. Debug output restores and displays the original stepped-to instruction in CURR: .
M	M [START [B0..B15]]	Modify/deposit memory. Inline deposit supports up to 16 bytes.	Interactive mode: CR/LF = next, . ends. CRLF pair counts as one next.
F	F START END B0[..B15]	Fill inclusive range with repeating 1..16 byte pattern.	No interactive mode. Verifies each write.
C	C SRC_START SRC_END DST_START	Copy inclusive source range to destination.	Overlap-safe (forward/backward selection). Verifies each write.
S	S B START END ... or S C START END TEXT	Search memory for byte patterns or text.	Prints hit address plus aligned row base context.
L	L S L G S L B ADDR LEN	Load Motorola S-records or raw bytes.	L G S / LGS auto-jumps to the S7/S8/S9 start address after successful load.
!	!F ..., !M ..., !C ..., !A ..., !N, !R START	Force-prefix for protected commands and explicit run override.	Allows access to protected low RAM (\$0000-\$0FFF). For R with active context, !R START force-runs from address and drops old context.
Q	Q	Enter WAI halt loop.	IRQ masked. Resume by NMI (or Reset). NMI latch returns cleanly to monitor.
V	V	Show vector jump chains.	Spaced format: RST: FFFC > F818 > 8004 > A8CB > [0080] > 800D. IRQ appends sub-dispatch lines: BRK: XXXX <name> and HW: YYYY <name>. Bracketed links use [addr16] and indicate a patchable 16-bit

2.1) Reading V Output

Example chain output:

```
RST: FFFC > F818 > 8004 > A8CB > [0080] > 800D **RST_PLACEHOLDER**
NMI: FFFA > 8007 > [0083] > A8E8           **NMI_PLACEHOLDER**
IRQ: FFFE > 800A > [0086] > A941 > BSO2_IRQ_BRK_HW_DISPATCH
     BRK: [0089] > A952 **BRK_PLACEHOLDER**
     HW:  [008C] > A980 **HW_PLACEHOLDER**
```

- Each `>` is one control-transfer hop in the chain as traced by the monitor.
- `FFF`, `FFF`, and `FFF` are fixed hardware vector locations (RST/NMI/IRQ+BRK).
- `F818` is the WDC ROM reset bridge; `8004`/`8007`/`800A` are monitor-side vector entry stubs.
- Bracketed entries like `[0080]`, `[0083]`, `[0086]`, `[0089]`, `[008C]` are patchable RAM JMP trampolines in zero page.
- Unbracketed high addresses (for example `A8CB`, `A8E8`, `A941`, `A952`, `A980`) are current resolved code targets and can move between builds.
- The IRQ main line ends with `BSO2_IRQ_BRK_HW_DISPATCH` because IRQ first lands in a common front-end, then runtime-dispatches to BRK or hardware IRQ sub-hooks.
- Design takeaway: high flexibility by design: one stable IRQ entry, two independently patchable sub-dispatch paths (BRK/HW).
- The `**..._PLACEHOLDER**` suffixes are handler-name slots printed with each chain/sub-chain; in a fully named build they identify the currently bound handler symbol/name.

3) Interactive Caveats

- `M` interactive: two hex digits are required per byte write (`00..FF`).
- `A` interactive: type one mnemonic/operand per prompt, `.` exits assembler mode.
- `.` exits interactive modify and retains next-address state for subsequent `M`.
- `CR` or lone `LF` advances to next address.
- `CRLF` pair is consumed as a single next-step.
- `F` does not support interactive mode.
- At an empty monitor prompt, Up Arrow (`ESC [A`) repeats and executes the previous command.
- Special repeat behavior: if the previous command was a `D ...` or `U ...` form, up-arrow replays bare `D/U`; `D` continues by saved span, `U` by saved next-instruction address.
- `F/M/C/A/N/L` block access to `$0000-$0FFF` unless prefixed with `!`. `D` is always allowed.
- Direct vector-hook edits with `!M` are non-atomic and debug-only. Writing live bytes at `$0080-$0088` (especially `$0083-$0085`) can produce mixed-byte jumps, wrong dispatch, hangs/crashes, or temporary vector-name mismatch while patching.
- Game ask hook (`GAME ASK`, older text: `POST ASK`) is sticky: when set, it prints at each prompt until cleared.
- Hook flag is fixed/reserved at `$0078` (`GAME_ASK_PENDING`). Manual control: `!M 78 01` sets pending; `!M 78 00` clears pending.
- `GAME_ASK_PENDING` defaults to `01` only on power-on/invalid-cookie path; reset warm paths preserve current `$0078` value.
- Terminal width byte is fixed/reserved at `$007A` (`TERM_COLS`): `14/28/50/84` for `20/40/80/132` columns.
- Terminal-width prompt timeout byte is fixed/reserved at `$007B` (`TERM_WIDTH_TIMEOUT`): `00=wait forever`, `01-FF=seconds`, default `08`.
- User ZP range is reserved at `$0090-$0FFF`.
- User-program origin policy: avoid `$0000-$0FFF` in normal operation (protected by default for write/execute-adjacent commands).
- Input ring overflow is handled by dropping the in-flight line to end-of-line; monitor prints `INPUT OVERFLOW; LINE DROPPED` once after resync.
- Minimum practical user-program origin is `$0800`.
- Preferred default user-program origin is `$1000` (recommended for demos and monitor interoperability).

4) Verify / Error Outputs

Operation	Message / Behavior
Modify verify fail	M VERIFY FAILED AT ADDR + failing address.
Fill verify fail	F VERIFY FAILED AT ADDR + failing address.
Copy verify fail	C VERIFY FAILED AT ADDR + failing address.
Dump range error	D RANGE ERROR .
Unassemble range error	U RANGE ERROR .
Assembler branch range error	A BRANCH RANGE ERROR .
BRK debug context	Printed as two lines: CURR: and NEXT: on one line, then STATE: on the next line. For N-generated temporary breaks, CURR: shows the restored original instruction.
R START while context active	R CTX ACTIVE, R [A/X/Y=] or !R START .
Bad syntax	Per-command usage lines (e.g. USAGE: M [START [B0..B15]]).

5) API Reference (Macros and Functions)

Use this section when calling monitor functionality from your own assembly code.

Include model: prefer `INCLUDE EQUATES.INC` for monitor builds; `EQUATES.INC` automatically includes `MACROS.INC`.

5.1) Macro Reference (`macros.inc`)

Macro	Parameters	Behavior / Notes
PUSH	PUSH p1 [,p2] [,p3] [,p4]	Pushes listed registers in given order. Supported tokens: A/X/Y/P (case-insensitive).
PULL	PULL p1 [,p2] [,p3] [,p4]	Pops listed registers in given order. Keep ordering compatible with prior PUSH.
REPEAT	REPEAT Routine, Count	Calls JSR Routine repeatedly Count times. Preserves X via push/pull.
PRT_CSTRING	PRT_CSTRING Label	Prints null-terminated string at Label via PRT_C_STRING .
DUMP	DUMP Start, EndExclusive	Convenience wrapper for MEM_DUMP with explicit exclusive end.
FILL	FILL Start, EndInclusive, B0 [,B1] [,B2] [,B3] [,B4]	Loads pattern bytes (1..5) and calls MEM_FILL_PATTERN . End is inclusive in macro syntax.
COPY	COPY SrcStart, SrcEndInclusive, DstStart	Calls overlap-safe MEM_COPY_RANGE . Source end is inclusive in macro syntax.
COPY_BLOCK	COPY_BLOCK SrcStart, Length, DstStart	Compatibility wrapper that expands to COPY SrcStart,(SrcStart+Length-1),DstStart .

CMP_CSTRING	CMP_CSTRING AddrA, AddrB	Wrapper for project-specific string compare symbols/routine (<code>STRCMP_PTR_*</code> , <code>STR_COMPARE</code>). Use only when those symbols are provided by your build.
-------------	--------------------------	---

5.2) Callable Function Reference

Practical entry points for extensions and integration.

Routine	Input	Output	Flags	ZP / Memory Use
INIT_SERIAL	None	UART initialized	Unchanged	None
WRITE_BYTE	A=char	Char sent to UART, LED updated	Unchanged	None
READ_BYTE	None	A=received char (ROM read)	ROM-defined	None
CHECK_BYTE	None	A=status	C=1 if RX empty	None
RBUF_INIT	None	Input ring reset	Unchanged	Uses generic buffer descriptor core
BUF_INIT	Active descriptor pointers set	Head/Tail/Count zeroed	Unchanged	Uses <code>BUF_*_PTR</code>
BUF_PUT_A	A=byte	Byte queued	C=0 stored, C=1 full	Uses <code>BUF_*_PTR</code> , <code>BUF_SIZE</code>
BUF_GET_A	None	A=byte	C=0 byte, C=1 empty	Uses <code>BUF_*_PTR</code> , <code>BUF_SIZE</code>
CMD_DISPATCH	A=command letter	Handler called from table	C=0 handled, C=1 unknown	Uses <code>CMD_TABLE</code> , <code>CMD_POST_ACTI</code> ON
MEM_DUMP	<code>PTR_DUMP_CUR</code> =start (inc), <code>PTR_TEMP</code> =end (exc)	Formatted hex+ASCII dump with 8+8 separator	Unchanged	Uses <code>PTR_DUMP_CUR</code> , <code>PTR_DUMP_END</code> , <code>PTR_LEG</code> , <code>MEM_DUMP_CNT</code>
MEM_DISASM_65C02	<code>PTR_DUMP_CUR</code> =start (inc), <code>PTR_TEMP</code> =end (inc)	65C02 disassembly output (ADDR: MNN OPERAND)	Unchanged	Uses <code>PTR_DUMP_CUR</code> , <code>PTR_DUMP_END</code> , <code>PTR_TEMP</code> , <code>PTR_LEG</code> , <code>DIS_*</code>
MEM_FILL_PATTER	<code>PTR_DUMP_CUR</code> =start (inc), <code>PTR_DUMP_END</code> =end (exc), <code>F_COUNT</code> =pattern length, <code>F_PATTERN</code> =pattern bytes	Fills range with repeating pattern	C=0 complete, C=1 aborted (verify/protection)	Uses <code>PTR_DUMP_CUR</code> , <code>PTR_DUMP_END</code> , <code>F_COUNT</code> ,

				F_PATTERN , F_PAT_IDX
MEM_COPY_RANGE	PTR_LEG=src start (inc), PTR_DUMP_END=src end (exc), PTR_TEMP=dst start	Copies source to destination (overlap-safe)	C=0 complete, C=1 aborted (verify/protect)	Uses PTR_LEG , PTR_DUMP_CUR , PTR_DUMP_END , PTR_TEMP , CMD_PARSE_VAL
CMD_DO_ASM	CMD_LINE = A START [INSN]	Interactive tiny assembler	. exits	Uses CMD_LINE , PTR_TEMP , opcode tables , and ASM_* / DIS_* scratch

6) Parser and Buffer Limits

- CMD_MAX_LEN = 64 characters (excluding null terminator).
- RBUF_SIZE = 32 bytes.
- On ring overflow, input is resynchronized to CR/LF and the partial line is dropped.
- One-command history is kept for up-arrow repeat (CMD_LAST_LINE).
- Hex token parser accepts 1..4 hex digits, optional \$ prefix.
- M and F inline byte lists: max 16 bytes each.
- ! is consumed as a command prefix, then normal parsing continues.

7) Memory Usage

Build Section Usage (current)

Section	ORG	Size (hex)	Size (dec)
PAGE0	\$0030	\$60	96
CODE	\$8000	\$32BF	12991
KDATA	\$B2BF	\$15EE	5614
UDATA	\$0200	\$EC	236
Total	-	\$49F9	18937

RAM Layout Highlights

- PAGE0 starts at \$0030 . Includes parser state, dump state, debug snapshot, vector hooks, and active buffer descriptor pointers.
- Guard policy reserves monitor PAGE0 through \$008F ; user ZP is reserved at \$0090-\$00FF .
- KDATA floats directly behind CODE (current build start: \$B2BF).
- Fixed/pinned bytes: GAME_ASK_PENDING=\$0078 , BRK_FLAG=\$0079 , TERM_COLS=\$007A , TERM_WIDTH_TIMEOUT=\$007B , RST_HOOK=\$0080 , NMI_HOOK=\$0083 , IRQ_HOOK=\$0086 , BRK_HOOK=\$0089 , HW_HOOK=\$008C .
- Hardware vectors are fixed at the top page: NMI=\$FFFA , RST=\$FFFC , IRQ/BRK=\$FFFF .
- Detailed zero-page map: [zero-page-usage.md](#) and [zero-page-usage.pdf](#) .
- UDATA starts at \$0200 :

RBUF_DATA 32 bytes
CMD_LINE 65 bytes (64 + NUL)
CMD_LAST_LINE 65 bytes (64 + NUL)
RESET_COOKIE 4 bytes

RNG_STATE	1 byte
F_PATTERN	16 bytes
DBG_TAG_BUF	6 bytes

8) Notes for Integrators

- Command parser uppercases incoming command bytes before parse/dispatch.
- Command execution is table-driven via `CMD_TABLE`.
- Input buffering now uses a generic descriptor-based core bound to the ring buffer.
- `Q` path relies on NMI latch (`SYSF_NMI_FLAG_M`) and then re-enters monitor cleanly.

9) Planned Commands (Appendix, Provisional)

This appendix documents planned command architecture and roadmap intent only.

Proviso: change is constant. These plans are not stable API and may change before publish.

9.1) Grammar Direction

- Primary model: noun verb [args...] (namespace first, action second).
- Direct-action commands may still exist where practical (for example jump/execute style flow).
- Parser should accept both spaced and fused forms for operator speed.

9.2) Canonical Input Compatibility

- Parser policy: token 1 selects namespace and remains locked for that line (no cross-namespace fallback).
- `X S` and `XS` should map to the same internal command key.
- `X R` and `XR` should map to the same internal command key.
- `M D` and `MD` should map to the same internal command key.
- `I O V` and `IOV` should map to the same internal command key.
- `I C` and `IC` should map to the same internal command key.
- One canonical dispatch representation is preferred to avoid duplicate handlers.
- Aliases are spelling variants only (same meaning); command override behavior is intentionally avoided.

9.3) Namespace Plan

Root	Planned Role	Notes
<code>B</code>	Bank / FLASH	Reserved for FLASH-related operations (read/program/erase/verify family).
<code>I</code>	Info root	Carries nested subfamilies such as time and I/O.
<code>I T</code>	Time	Time remains planned under Info; top-level <code>T</code> is active for terminal operations (clear + width).
<code>I C</code>	Calculator	Implemented baseline (<code>I C / IC</code>) with 16-bit hex RPN tokens; future expansion remains planned.
<code>T</code>	Terminal	Repurposed top-level namespace for terminal-related operations.
<code>I O P</code>	PIA	Top-level <code>P</code> is freed; PIA moves under Info/I/O.
<code>I O V</code>	VIA	Top-level <code>V</code> is freed; VIA moves under Info/I/O.
<code>I O V T</code>	VIA timers	Hardware timers are expected under VIA tree.
<code>J</code>	Jump / Execute	Preferred home for execute flow if top-level execute letter changes.

X	Transfer / XMODEM	At minimum: send and receive support.
S	Search	Text and binary search families.
M	Memory family	Supports compact forms such as MD / MM as aliases.
O	Deferred decision	Candidate: chained execution wrapper; decision postponed.

9.4) Search Family Detail

- Planned base forms: S C START END <text> and S B START END <pattern...>.
- Current hit display format is <HIT_ADDR>{ |*}<ROW_BASE>: ... ; HIT_ADDR is exact match start, and ROW_BASE = HIT_ADDR & \$FFF0 .
- Separator marker: * means the match continues into the next 16-byte row (for example \$B8AF*\$B8A0 implies continuation at \$B8B0).
- S C mode: unquoted text stops at first whitespace.
- S C mode: quoted delimiters can include ", ', and `.
- S C mode: delimiter escape by doubling delimiter character.
- S C mode wildcards: ? matches exactly one character, * matches zero or more characters.
- S C mode literals: ?? matches literal ?, and ** matches literal *.
- S B mode tokens: HH byte, HHHH little-endian word, nibble wildcard (?A/A?/?), and * byte wildcard.
- Candidate extensions: Pascal strings and high-bit-set text search modes.

9.5) XMODEM Requirement

- Before publish, provide both XMODEM receive and send paths.
- Preferred forms: X R ... and X S ... with fused aliases (XR , XS).

9.6) Vector + Safety Direction (Pre-Publish Requirement)

- Vector updates must support dynamic atomic update behavior.
- Handler-name contract direction: every patchable target exports <HANDLER> and <HANDLER>_NAME (ASCIIZ); retarget operations update target address and name pointer together.
- Critical windows include vector commit and FLASH routines.
- During critical windows, all EDU LEDs should flash to signal that NMI should not be pressed.
- NMI path should be guarded/deferred during critical windows instead of normal debug flow.
- Staged-update plus atomic-commit behavior is the intended implementation pattern.
- NMI retargeting direction: patch inactive slot fully, then commit via single-byte active-slot selector flip (no in-place live NMI hook rewrite).
- Direct !M edits to live vector hook bytes are allowed for bring-up/debug but are intentionally outside the production-safe retarget path.
- Mandate (non-changing requirement): any operation that mutates FLASH state or vector state must assert critical indication/guard behavior, including module/transient load paths; implementation detail may change, requirement does not.

9.7) Deferred Item

- O command semantics are intentionally deferred.
- If adopted as an operation chain wrapper, error policy and guard policy must be defined explicitly.

9.8) Active TODO (Pressing)

Now

- TODO: rework bso2 wrapper/trampoline entry points for WDCMONv2 FLASH routines; current WDCMONv2 FLASH programming flow is tied to Python tooling and needs a rethink for this project.
- TODO: add a post-link map check that enforces END_KDATA < \$F000 .

Soon

- TODO: get the ACIA port on the EDU board running.

Before Publish

- TODO: provide XMODEM receive and send paths before publish (X R/XR, X S/XS).
- TODO: implement staged vector update plus atomic commit flow for runtime retargeting.
- TODO: enforce critical-window behavior for FLASH/vector mutation paths (LED warning plus NMI guard/defer).
- TODO: enforce dangerous B operation policy (! required, explicit confirmation, and fail-closed behavior without mutation).
- TODO: add deterministic status reporting for dangerous operations (status code byte plus OK / ABORTED / VERIFY_FAIL / FLASH_FAIL / DENIED).
- Deferred (not current TODO): text compression/decompression, tokenization/RLE, and TX ring architecture while 32K FLASH headroom is sufficient.

9.9) Flash / Bank Safety Policy (Critical, Non-Negotiable)

- B must not execute dangerous operations by default.
- bso2 plans to use WDCMONv2 FLASH routines through wrappers/trampolines, but current WDCMONv2 FLASH programming flow is tied to Python tooling and requires a rethink.
- Integration intent is behavioral/protocol compatibility via wrapper entry points, not direct source-text copy.
- Any dangerous B operation requires both force-prefix ! and explicit user confirmation.
- Dangerous operations include at minimum erase, program/write, monitor self-update, vector commit, and bank activation/commit transitions.
- If ! is absent, dangerous operations fail closed with no side effects.
- Confirmation must be operation-specific (typed intent token), not an implicit continue.
- During dangerous operations: enter critical guard mode before mutation starts, flash all LEDs, and guard/defer NMI debug flow until critical mode exits.
- On verify/check failure: abort mutation, exit critical mode cleanly, and report explicit status.
- Required output for dangerous operations: status code byte plus textual result (OK, ABORTED, VERIFY_FAIL, FLASH_FAIL, DENIED).

9.10) Board Self-Update Policy

- Board self-update is always dangerous and always requires ! plus explicit confirmation.
- Before final commit, display target region, byte count, and integrity value (checksum/hash when available).
- Preferred execution shape: preflight validation, stage payload, erase/program, verify, then commit/activate.
- Avoid in-place blind overwrite as the only strategy; preserve a recovery path.
- Self-update is fully covered by the non-changing mandate: any FLASH/vector mutation path (including module/transient load/activation) must assert critical indication and guard behavior.

9.11) Host Tooling Direction (Linux GNU C)

- Critical FLASH workflows are expected to have a Linux GNU C host path.
- Python helpers may exist for convenience, but they are not the required path for critical FLASH operations.
- Preferred host model: raw serial protocol wrappers in C with explicit timeout/error handling and deterministic status reporting.

10) Legal Notice

- WDC, W65C02, and W65C02EDU are names associated with Western Design Center, Inc.
